PROJECT DOCUMENTATION

STUDENT INTERNSHIP TRACKER

A Java Full-Stack Web Application for Managing Internship Applications and Learning Experiences

FRONTEND	BACKEND	DATABASE
HTML • CSS • JavaScript	Java • Spring Boot	MySQL

ABSTRACT

Student Internship Tracker is a web-based application designed to help students organize internship applications and maintain records of completed internship experiences. Students can store company and role details, record application dates, update application statuses, and document the duration and learning outcomes of completed internships.

INTRODUCTION

Students may apply to multiple internship opportunities and need a convenient way to track each application. When details are stored in different places, it can become difficult to monitor progress and remember the experience gained. This project provides one centralized website for managing internship information throughout the application process.

PROJECT OBJECTIVES

- Maintain internship application details in one place.
- Track progress through clear application statuses.
- Record duration and learning details for completed internships.
- Make internship information easy to view, edit, and manage.

PROJECT OVERVIEW

Problem Statement & System Design

PROBLEM STATEMENT

A student wants to keep track of internship applications and report completed internship experiences. The system must support creating and managing applications, tracking their status, and collecting additional information when an internship is completed.

PROPOSED SYSTEM

The proposed system is a centralized website. Students can add, view, edit, and delete internship applications. Each record includes company name, role, application date, and status. When a record is marked **Internship Completed**, the system requires the internship duration and a short learning description.

FUNCTIONAL REQUIREMENTS

No.	Requirement	Description
1	**Application Management**	Add, view, edit, and delete internship applications.
2	**Application Details**	Store company name, role, and application date.
3	**Status Tracking**	Applied, Selected, Rejected, and Internship Completed.
4	**Completion Details**	Internship duration is required when marked completed.
5	**Learning Record**	A short learning description is required on completion.

TECHNOLOGY STACK

Layer	Technology	Purpose
Frontend	HTML, CSS, JavaScript	Website layout, styling, forms, and interactions.
Backend	Java, Spring Boot	Application logic, validation, and server-side processing.
Database	MySQL	Store internship and completion records.
Persistence	Spring Data JPA	Connect Java entities and repositories with MySQL.

DATABASE DESIGN

Suggested database: **interntrack**. Main table: **internships**. Fields: id (INT, primary key), company_name (VARCHAR), role (VARCHAR), application_date (DATE), status (VARCHAR), duration (VARCHAR, nullable until completed), and learning_description (TEXT, nullable until completed).

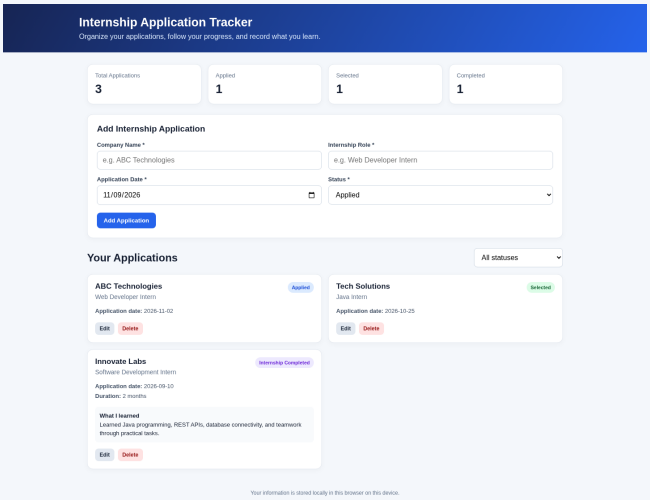

HIGH-LEVEL ARCHITECTURE

Frontend HTML, CSS, JavaScript	**Java Backend** Spring Boot	**Database** MySQL

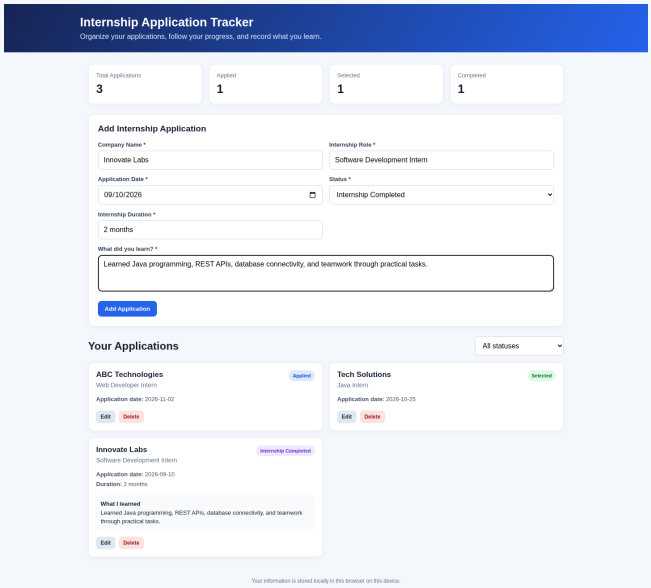

WEBSITE SCREEN PREVIEWS

Application Screens

The following screen previews are generated from the HTML interface you provided. The sample company records are illustrative data used to demonstrate the layout and functions.

Screen 1: Dashboard and Applications
Displays summary counts, the add-application form, saved application cards, status labels, and Edit/Delete actions.

Screen 2: Completed Internship Form
When Internship Completed is selected, duration and learning description fields appear and are required.

WORKFLOW

1. Add an internship application. **2.** Update its status. **3.** If completed, enter duration and learning details. **4.** Save and manage the record later.

TESTING PLAN

Verify Add, View, Edit, and Delete operations; confirm that all four statuses can be selected; and check that a completed internship cannot be submitted without duration and a learning description. The supplied HTML currently stores information in the browser's local storage; the planned Java Spring Boot and MySQL backend must be connected for database persistence.

CONCLUSION & FUTURE ENHANCEMENTS

The Student Internship Tracker provides a structured way to manage internship applications and document completed experiences. Future enhancements may include student login, search and filtering, dashboard analytics, and downloadable experience reports.

Implementation note: The screenshots show the supplied frontend preview. They do not demonstrate a connected Spring Boot backend or MySQL database.
